Chapter 2

In this Chapter, I get my hands on the code.

I installed Mono using the following process.

```
sudo gpg --homedir /tmp --no-default-keyring --keyring /usr/share/keyrings/mono-official-archive-keyring.gpg  
echo "deb [signed-by=/usr/share/keyrings/mono-official-archive-keyring.gpg] https://download.mono-project.com/archive/latest/debian/debian.debkeys.asc" >/etc/apt/sources.list.d/mono-official-archive.list  
sudo apt update  
sudo apt install mono-devel
```

After that I could compile the example code from the book using:

```
mono-csc -target:exe TestApp.cs
```

And for multiple source code file:

```
mono-csc -r:System.Windows.Forms.dll TestApp.cs HelloMessage.cs
```

We can also use a response file instead of adding the parameters in the command line.

Here is the content of the `TestApp.rsp` file:

```
/r:System.Windows.Forms.dll  
/target:exe /out:TestApp.exe *.cs
```
